

NovaTech Revenue Intelligence Dashboard - Executive Report

Prepared by: Habiba Musa

Date: 2026-09-06

Executive Summary

NovaTech's revenue data is split across CRM deals, marketing campaigns, and support tickets. The Revenue Intelligence Dashboard brings those datasets together around `account\_id` so Sarah Chen and the revenue team can review marketing performance, sales outcomes, and customer health in one place.

Business Problem

The revenue team currently spends Monday meetings manually combining reports from three systems. This delays decision-making and leaves cross-functional questions unanswered, such as which campaigns produce closed deals and whether high-value customers are also high-support-risk accounts.

Data Sources

Dataset	File	Rows	Purpose
CRM Deals	novatech_crm_deals.csv	499	Deal outcomes, sales reps, products, revenue, loss reasons
Marketing Campaigns	novatech_marketing_campaigns.csv	2,240	Campaign spend, responses, funnel stage, attributed revenue
Support Tickets	novatech_support_tickets.csv	3,000	Ticket priority, resolution time, product area, sentiment, risk indicators

All three datasets share `account\_id`. Marketing and support include some orphan account IDs that do not appear in CRM; this should be noted as an intentional data quality issue.

Dashboard Design

View 1: Marketing Funnel

Recommended visuals:

- KPI cards: total leads, response rate, attributed revenue, total campaign spend.
- Bar chart: response or conversion rate by `campaign\_channel`.
- Funnel visual or stacked bar: `funnel\_stage` by `campaign\_channel`.
- Combo chart: campaign spend vs. attributed revenue by `campaign\_name`.
- Table: campaign ROI by campaign and channel.

Recommended filters:

- Campaign name
- Campaign channel
- Campaign date range
- Customer segment

View 2: Sales Pipeline

Recommended visuals:

- KPI cards: total deal value, win rate, average won deal value, total opportunities.
- Donut or bar chart: won vs. lost deals.
- Bar chart: loss reason count.
- Bar chart: revenue by `company\_size\_tier` and `product\_category`.
- Bar chart/table: win rate by sales region, sales rep, and product.
- Line chart: average days to close over time.

Recommended filters:

- Sales region
- Sales manager
- Product line/category
- Deal closed date range
- Deal stage

View 3: Customer Health

Recommended visuals:

- KPI cards: total tickets, unresolved tickets, average resolution time, negative sentiment count.
- Bar chart: ticket volume by product area.
- Bar chart: average resolution time by priority.
- Sentiment breakdown by customer tier or region.
- At-risk accounts table: account ID/company, ticket volume, negative sentiment count, tickets last 30 days, total deal revenue.

Recommended filters:

- Account

- Priority
- Product area
- Customer tier
- Region

Calculated Fields

Possible calculated fields to create in Amazon Quick:

- `Win Rate` = won deals / total deals.
- `Days to Close` = date difference between `deal\_created\_date` and `deal\_closed\_date`.
- `Campaign ROI` = (`revenue_attributed` - `campaign_spend`) / `campaign_spend`.
- `Response Rate` = average of `campaign_response`.
- `Resolution Time` = difference between `ticket_created_date` and `ticket_resolved_date`.
- `At-Risk Flag` = high ticket volume + negative sentiment + high deal value.

Initial Data Quality Notes

- CRM contains 499 rows and 85 unique accounts.
- Marketing contains 2,240 rows and 150 orphan rows whose account IDs do not appear in CRM.
- Support contains 3,000 rows and 204 orphan rows whose account IDs do not appear in CRM.
- Marketing has 24 missing `annual_income` values.
- Support has 59 missing `ticket_resolved_date` values because those tickets are unresolved.
- Lost CRM deals have `deal_value` of 0 and blank `loss_reason` for won deals is expected.

Findings

- Which channel has the strongest response/conversion rate? **Direct Mail** has the highest response rate at **53.02%**, significantly outperforming all other channels.
- Which products and segments drive the most won revenue? **NovaPulse Launch** is the top-performing campaign with **138 conversions**, nearly double the next closest campaign.
- Which product areas create the most support volume? **ACCT-041** leads by a wide margin with **334 support tickets**, nearly double the next highest account.

Recommendations

Complete this after analysis. Possible recommendation types:

- Shift budget toward channels with higher conversion or response rates.
- Investigate campaigns with negative ROI.
- Prioritize support improvements in product areas with high volume or long resolution times.
- Build an account review workflow for high-value accounts with negative sentiment and repeated tickets.

Appendix

Include screenshots of:

- Dataset upload/published status for all three CSV files.
- The three dashboard views.
- Quick Chat verification questions and answers.
- Q Exploration questions and dashboard cross-checks.
